

Forklift Extension Booms

Extension Boom for Forklift - Usually, we view forklifts as industrialized machinery used to be able to lift and move pallets. Nonetheless, there are extensions available to give the forklift more strength and more length for heavier loads. By using one of the four main forklift booms, your lift truck could be useful for a variety of other applications. The four major lift truck booms are the pipe boom, the shooting boom, the carpet boom and the coil boom. Each of these are designed for attachment onto your forklift.

Coil Poles

Coil poles are connected to the carriage of the forklift. They were designed for transporting rolled coils and other rolled materials such as concrete poles or reels of wire. Coil poles will enable you to transfer whatever cylinder or rolled material too.

Carpet Poles

Carpet poles are a heavy duty accessory constructed from EN24T metal. They mount directly onto the forklifts' carriage. They are known as carpet poles but are even used to be able to transfer other types of rolled floor coverings as well as cylinder products. They do not have the capability to lift really heavy items like for instance concrete pipes or coil poles.

Telehandlers or Shooting Forklift Booms

Shooting forklift booms are also called telehandlers or telescopic booms. They are very helpful on rough terrain forklifts and raise to heights of 20-40 feet. These booms are typically used outside on construction sites or within the agricultural industry.

Booms Must Not Be Used On Pipes

Whenever using the interior of whatever type of boom to be able to move pipe can bring about extreme damage. A hauling sling must be utilized instead of a pipe boom in this case. Sometimes, cylinder shaped pipes and steel pipes must be transferred utilizing a boom whenever a lifting sling is unavailable. In these instances, care must be taken to ensure the pipes interior integrity.

Additional Types

There are two additional booms that can be utilized by the forklift and they both attach to the forks rather than the carriage. They allow an easy transition from pallet to coiled or rolled stuff together with the additional benefit of offering a clear line of sight for the person operating it.

Guidance for Safety

Forklift operators have to finish a training course so as to learn how to drive the equipment in the most practical and safe way. This training is intended to keep the one operating it safe as well as to be able to avoid any injury to people working in the vicinity. Lift trucks are a heavy piece of industrial equipment and considered to be a potentially dangerous machine. People who work with and around them need to comply with and comprehend all of the safety measures.

Additional training should be provided to people who will be dealing with forklift booms. This would make certain they understand how to carefully operate the booms. Accidents have happened on the job from failure to carefully work a boom. Several makers provide training courses on the various types of booms and a few provide on-site education where workers can be trained directly where they will be working. This on-hand training allows the trainer an opportunity to tackle all safety concerns at that specific job location.
